Monday Reading Assessment: Unit 5, Field Induction and Inductance

Prof. Jordan C. Hanson

April 13, 2020

1 Memory Bank

- $\epsilon = -N\Delta\phi_m/\Delta t$ ... Faraday's Law
- $\phi_m = \vec{B} \cdot \vec{A} = BA\cos(\theta)$ ... Definition of magnetic flux
- $\epsilon(t) = \epsilon_0 \sin(\omega t)$ ... AC voltage generated by generator.
- $P_{ave} = \frac{1}{2}P_{max}$ ... Average power of an AC generator.

2 AC Generators

1. Consider Fig. 1. Suppose that the angle between the area vector and the magnetic field is $\theta = \omega t$. (a) Show that

$$\phi(t) = BA\cos(\omega t) \tag{1}$$

(b) Given Eq. 1, show that the voltage generated in the loop is proportional to $\sin(\omega t)$ and ω itself. That is, show that

$$\epsilon(t) = BA\omega\sin(\omega t) \tag{2}$$

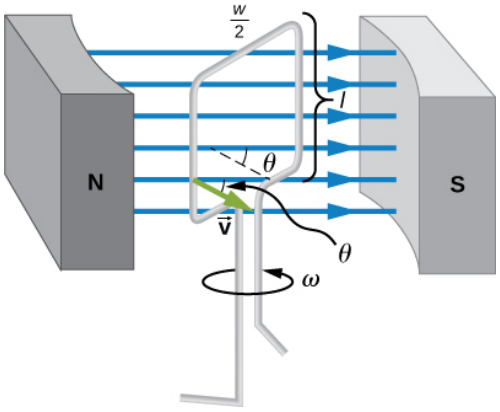

Figure 1: A schematic of the concept of an AC generator.

2. Suppose the AC generator in Fig. 1 has $V_0 = 12$ V so that $\epsilon(t) = V_0\sin(\omega t)$. (a) If $\omega = 120\pi$ rad/second, when is the voltage at maximum? (b) If the AC generator pushes current through a resistance R, what are the maximum and average powers generated?
