

Midterm 2 for Calculus-Based Physics-1: Mechanics (PHYS150-01)

Dr. Jordan Hanson - Whittier College Dept. of Physics and Astronomy

October 16th, 2017

1 Vectors and Newton's Laws

1. Practice the following skills with vectors: a) calculating the magnitude when the vector is given in algebraic form b) Summing vectors (as when obtaining net force) c) calculating the angle between two vectors using the dot product.

The dot product for vectors $\vec{f}_1 = f_{1x}\hat{i} + f_{1y}\hat{j}$ and $\vec{f}_2 = f_{2x}\hat{i} + f_{2y}\hat{j}$ is $\vec{f}_1 \cdot \vec{f}_2 = f_{1x}f_{2x} + f_{1y}f_{2y}$. The magnitude $|\vec{f}_1|$ of a vector \vec{f}_1 is $\sqrt{\vec{f}_1 \cdot \vec{f}_1}$ (Pythagorean theorem). If θ is the angle between two vectors \vec{f}_1 and \vec{f}_2 , then $\vec{f}_1 \cdot \vec{f}_2 = |\vec{f}_1||\vec{f}_2|\cos\theta$

2. Practice drawing a free-body diagram that includes all *external* forces on the *system*. Understand that centripetal force is not an *external* force, but a force that describes circular motion and is supplied by some external effect like gravity.
3. Practice drawing a free-body diagram that describes an object on an incline plane.

2 Newton's Laws, and Circular Motion

1. The displacement Δs around a circle of radius r is given by $\Delta s = r\Delta\theta$, where $\Delta\theta$ is the *angular* displacement. The derivative of the angular displacement is ω , with $v = r\omega$.
 - The centripetal acceleration is $a_C = v^2/r = r\omega^2$.
 - The centripetal force is $F_C = mv^2/r = mr\omega^2$.

3 Frictional Forces

1. Practice drawing free-body diagrams that include frictional forces. What should be the direction of the frictional force?
2. Let N be the magnitude of the normal force. If a frictional force is *static*, then the magnitude of that force is $f_{f,s} = \mu_s N$. If the frictional force is *kinetic*, then the magnitude of that force is $f_{f,k} = \mu_k N$. Usually, $\mu_k < \mu_s$.
3. We encountered two forces of friction not associated with surface contact: drag forces. One drag force was given by Stoke's Law: $F_D = 6\pi r\eta v$.
 - r is the radius of the object moving through the medium in meters.
 - η is the *viscosity* of the fluid in $\text{kg}/(\text{m s})$.
 - v is the velocity of the object in m/s .
 - The force points in the opposite direction of velocity.
4. One other drag force was given by the following: $F_D = \frac{1}{2}C\rho A v^2$.
 - C is a dimensionless empirical constant (usually close to 1).
 - ρ is the density of the fluid or gas through which the system moves, in kg/m^3 .
 - A is the cross-sectional area of the system moving through the fluid or gas, in m^2 .
 - v is the system velocity in m/s .
