

Physics Midterm 2

1. a)

$$b \quad a = \frac{F_t - F_a - mg}{m} = \frac{1.230 \cdot 10^7 \text{ N} - 4.50 \cdot 10^6 \text{ N} - (5 \cdot 10^5 \text{ kg}) \cdot 9.8}{5 \cdot 10^5 \text{ kg}}$$

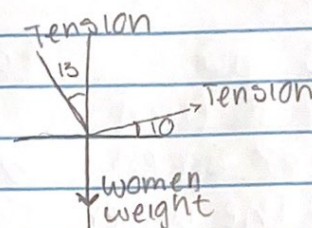

$$= 6.2 \text{ m/s}^2$$

2.

The force has to be equal of that exerted by the first player so it would be equal to -700.

3. The object also requires Friction to decelerate.

4.

$$\cos \theta = \frac{a}{n}$$

$$\cos 75 = -\frac{T_{1x}}{T_1}$$

$$T_{1x} = -T_1 \cos 75$$

$$\boxed{T_2 = 194 \text{ N}}$$

$$\boxed{T_1 = 738 \text{ N}}$$

Well done!

(-1) Numerical result for that friction?

$$F_{netx} = \max = 0$$

$$F_{nety} = \max = 0$$

1.

$$\mu_s = 0.3$$

$$F_a = 1.180$$

$$b) f_k = \mu_k F_a$$

$$\sum F_y = \max$$

$$\sum F_x = 0$$

$$F_a + w = 0$$

$$F_a - 1.180 = 0$$

$$F_s \leq 590 \text{ N}$$

$$= 0.3(1.180)$$

$$= 354 \text{ N}$$

$$\frac{590 - 354}{120} = 1.97 \text{ m/s}^2$$

$$2. g[\sin 25 - \cos 25] = a$$

$$3. F_D = \frac{1}{2} C_p A v^2$$

$$9.80[\sin 25 - \cos 25]$$

$$F_D = \frac{1}{2} (.75)(40)^2 (.75)(1.275)$$

$$= 3.25$$

$$= 551.3 \text{ N}$$

$$\begin{aligned}
 4. \quad A &= 2\pi r h + 2\pi r^2 \quad \ddot{x} = \frac{v}{t} \quad F = ma \\
 &= 2.52 \text{ m}^2 \quad \sigma = \frac{F}{A} \quad F = 1300 \cdot 9.81 \\
 &\text{initial} \quad A = 2.52 \text{ m}^2
 \end{aligned}$$

$$\begin{aligned}
 \frac{2.52 \text{ m}^2}{-0.0003} &= \boxed{-8400 \text{ kg/m}^2} \quad \epsilon = \frac{L - L_0}{L_0} \quad (-1) \\
 &= -0.0003
 \end{aligned}$$

$$\begin{aligned}
 1. \quad \omega &= v \cdot v / r^2 \\
 &= .5 / .44 \\
 &= \frac{1.51^2}{1.51^2} \\
 &= \boxed{80 \text{ rad/s}}
 \end{aligned}$$

$$\begin{aligned}
 2. \quad \tan \theta &= \frac{v^2}{rg} \\
 120 \text{ km/h} &= v \\
 v &= .9
 \end{aligned}$$

(-1) The driver would be sideways at this angle ...

3. Path two gives the ability to turn at a faster speed because of the wider angle. This way they have a maximum static friction.

$$\begin{aligned}
 \tan \theta &= \frac{120^2}{.9(9.81)} \\
 \theta &= \tan^{-1}(1630) \\
 &= \boxed{89.96^\circ}
 \end{aligned}$$

(-1) part b?

$$4. \quad a_c = \frac{Gm}{r^2}$$

$$a_c = \frac{6.673 \cdot 10^{-11} / (1.4 \cdot 10^{22})}{(4.50 \cdot 10^{12})^2}$$

$$a_c = \boxed{4.6 \cdot 10^{-14} \text{ m/s}^2}$$

$$b). \quad a_c = \frac{Gm}{r^2}$$

$$a_c = \frac{6.673 \cdot 10^{-11} (8.62 \cdot 10^5)}{(2.50 \cdot 10^7)^2}$$

(+2) Bonus

$$a_c = \boxed{9.2 \cdot 10^{-10} \text{ m/s}^2}$$
