Midterm 2 for Calculus-Based Physics-1: Mechanics (PHYS150-01)

Dr. Jordan Hanson - Whittier College Dept. of Physics and Astronomy
October 16th, 2017

1 Vectors and Newton's Laws

- 1. Let $\vec{F}_1 = \frac{3}{2}\hat{i} + 2\hat{j}$ N, and $\vec{F}_2 = -2\hat{i} + \frac{3}{2}\hat{j}$ N. a) Give the magnitude of each force. b) What is the net force? c) What is the angle between these two forces?
- 2. Imagine you are sitting in an airplane that has just lifted off with an acceleration vector 45 degrees with respect to horizontal. Draw a free-body diagram corresponding to you, showing all forces acting on you.
- 3. Imagine you are riding a skateboard down a hill (no friction), and the incline angle is 45 degrees. Draw a free-body diagram corresponding to you, showing all forces acting on you.

2 Newton's Laws, and Circular Motion

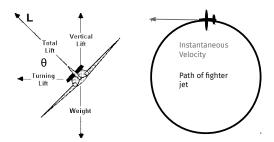

Figure 1: Let the weight be \vec{w} , and the total lift be \vec{L} , which may be be broken into two components: the turning force (equal to centripetal force $\vec{f}_{\rm C}$) and vertical lift (which balances weight).

- 1. When banking, the free-body diagram of a jet-fighter resembles Fig. 1. To bank while maintaining altitude, the lift force \vec{L} must both balance the weight \vec{w} and provide the centripetal force $\vec{f}_{\rm C}$. Let the mass of the aircraft be m, the radius of the turn be r, and the angle between \vec{L} and horizontal be θ .
 - Show that the angular velocity of the turn, ω , is $\omega = \sqrt{\frac{L\cos\theta}{rm}}$

• If ω is the angular velocity, then the <i>period</i> is $T=2\pi/\omega$. This is the time required to fly in a complete circle. Show that one-half period is $\frac{T}{2}=\pi\sqrt{\frac{rm}{L\cos\theta}}$. This is the time required to turn.
• Let $L=8\times 10^5$ N, $m=2\times 10^4$ kg, $r=\frac{1}{2}$ km, and $\theta=60$ degrees. How long does it take the jet fighter to turn?

- · What is the speed of the jet fighter?
 - A: 10 m/s
 - B: 20 m/s
 - C: 100 m/s
 - D: 120 m/s

3 Frictional Forces

- 0.1
- 0.2
- 0.5
- 1.2

- $5/(3\pi)$ kg/(m s)
- $5/(30\pi)$ kg/(m s)
- 10 kg/(m s)
- 5 kg/(m s)

^{3.} Suppose they get a sample of the mystery liquid in a vile. They assume the drag force is given by Stoke's Law, $F_{\rm D}=6\pi r\eta v$, where v is the velocity of a particle moving through they fluid, r is the radius of the particle, and η is the viscosity. They drop a bead with r=1 mm and a mass of one gram into the fluid, and observe the bead sink with a constant (terminal) velocity of 1 m/s. What is the viscosity of the fluid? Units: kg/(m s).
